GUI vs Command-Line

My main thoughts around GUI vs the command-line is that the GUI is much easier to use and understand. That's the purpose of it, to create an interface that's easy to interact with and perform the actions you need without having to know a bunch of specific terms to tell your computer what you want it to do. That being said, the command-line is very useful if you want to customize and change certain aspects of your computer or view specific information about it. Some examples of things you can do with the command-line would be: arranging your folders in an effective manner and easily viewing what they do, what's in them, and how they interact with each other. You can easily delete drives. Look up information about your computer in case you need to know something specific. And there's a lot of other options as well.

All in all though, unless I have a specific need to use the command-line, it just seems more convenient to me to use the GUI.
